Integrating monitoring to better understand patterns and trends in contamination and toxicity in California watersheds

Stream Pollution Trends Program (SPoT)

Brian Anderson UC Davis Department of Environmental Toxicology Granite Canyon Laboratory

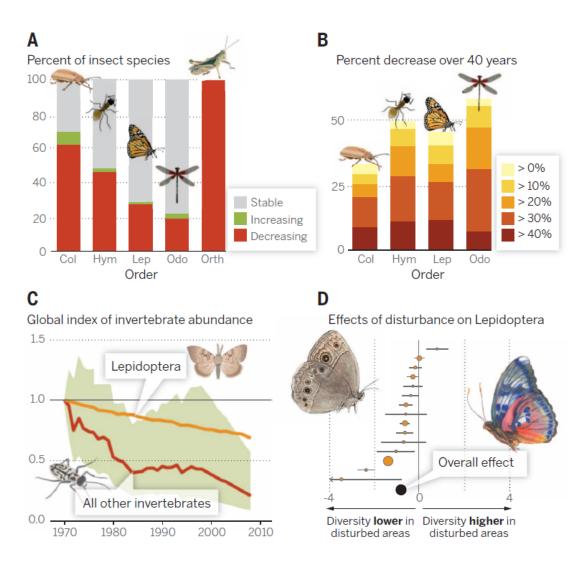

### Importance of Surface Water Toxicity Monitoring in California

- Surface water toxicity is pervasive in California.
- Between 2001 and 2010, 50% of sites had at least one toxic water or sediment sample.
- Evidence suggests toxicity to invertebrates is primarily caused by pesticides – chemistry + TIEs.
- A growing number of 303(d) listed water bodies have been listed due to toxicity caused by pesticides listings often lag behind current use.
- Water and sediment toxicity are linked to macroinvertebrate community impacts.

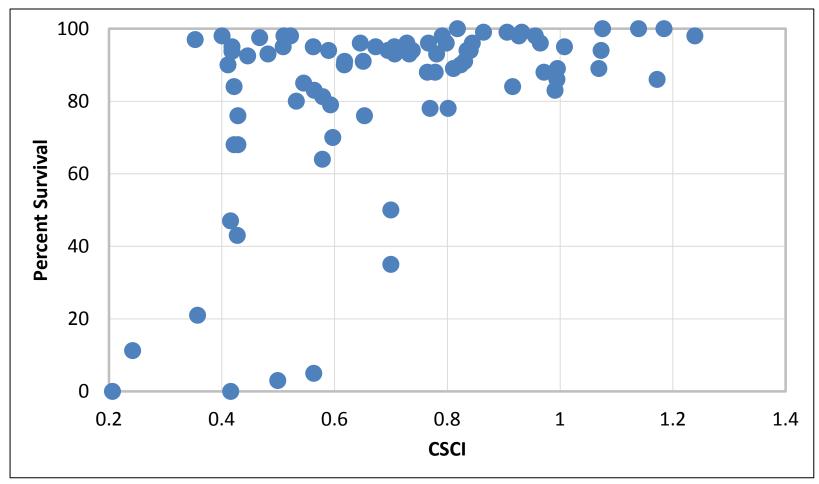

# Worldwide Insect Declines:

#### from Dirzo et al. 2014 Science

### Laboratory Toxicity Correlates with Instream BMI Impacts

 Linking laboratory toxicity results and field contamination with impacts to benthic macroinvertebrates will support causal assessments. Ultimately formulate hypotheses to test.

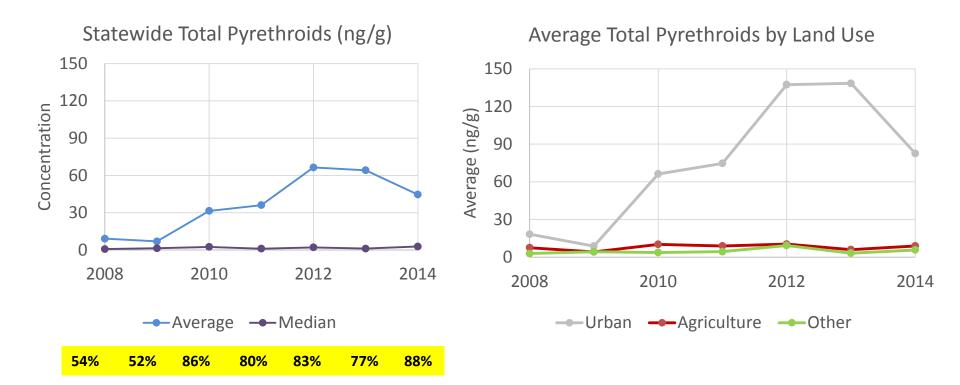

## **Current SPoT Design = Trend Analysis since 2008**

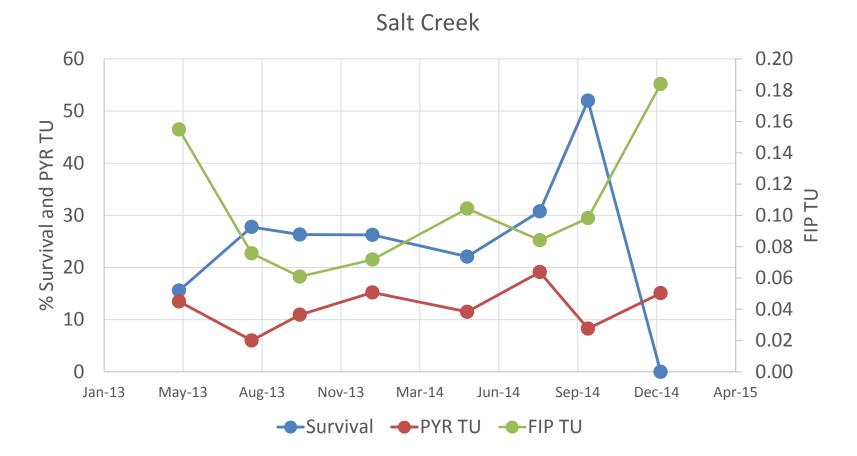

| Sites  | 50 Annually                      |  |
|--|----------------------------------|--|
| Siles  | 50 Bi-Annually                   |  |
| Toxicity   | Hyalella azteca (All Sites),     |  |
|  | Chironomus dilutus (Urban Sites) |  |
| Cold Toxicity  | Hyalella azteca (subset)         |  |
| Pyrethroids, OPs, OCs, PCBs, PAHs, PBDEs<br>and Metals | All Sites                        |  |
|  |                                  |  |
| Fipronil (as of 2013)                                  | Urban Sites                      |  |
| Microcystin (as of 2013)                               | All Sites                        |  |

## Are conditions getting better or worse? What is the magnitude and extent of any problems?

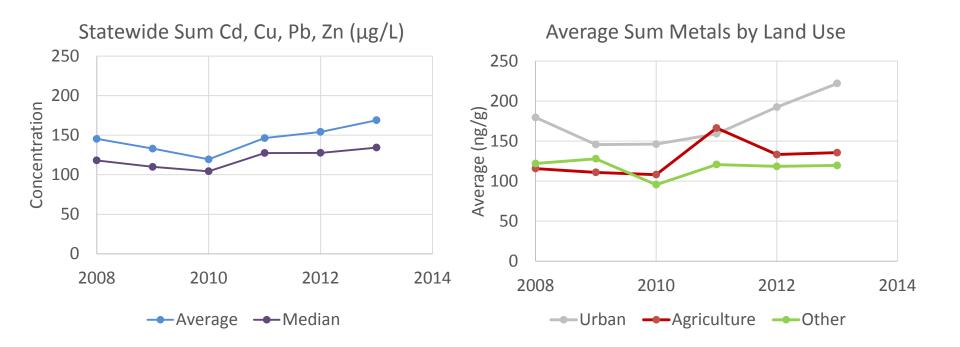

## Salt Creek (901INTSC5) – Integrated monitoring with DPR

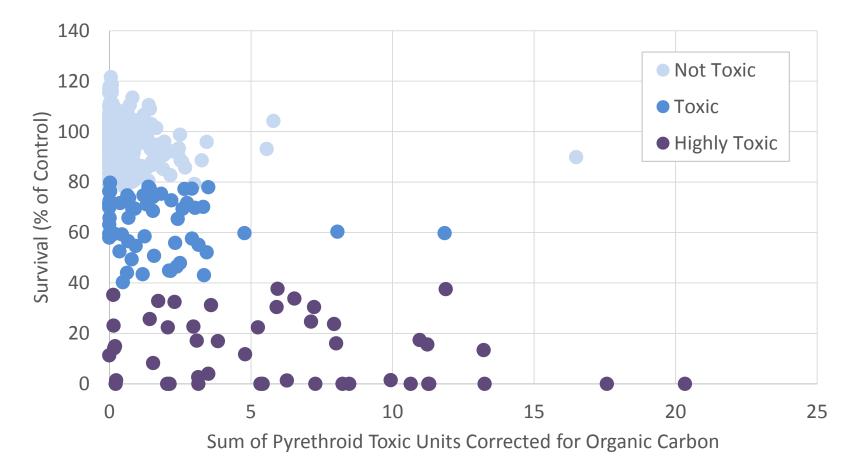

- Pyrethroids Consistent concentrations. Single and double-digit TUs.
- Fipronil Consistent concentrations at about one-tenth TU based on H. azteca LC50.

## Are conditions getting better or worse? What is the magnitude and extent of any problems?

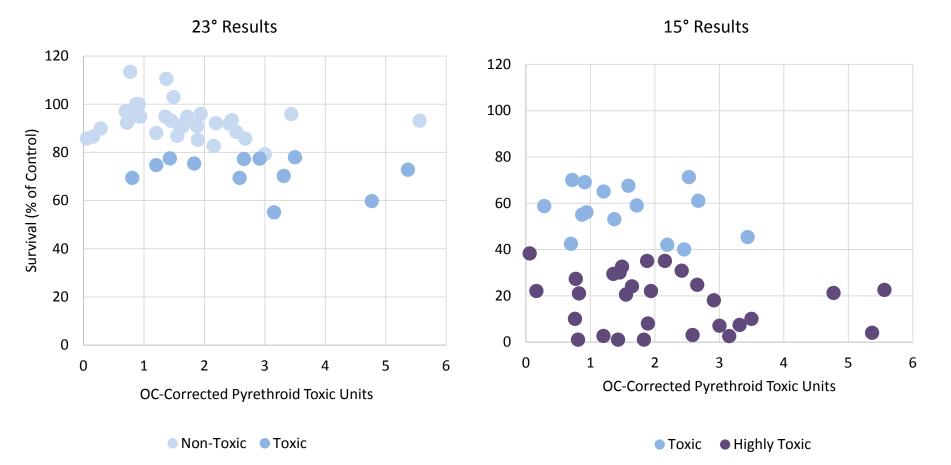

# What is causing the problem?

- Toxic unit calculated by dividing the measured concentration by the median lethal concentration (LC50) for *Hyalella azteca*.
- Pesticide LC50s were exceeded in 19% of the samples.

#### Confirmation pyrethroids are part of the problem

 Comparison of two temperature toxicity results plotted against organic carboncorrected toxic units.

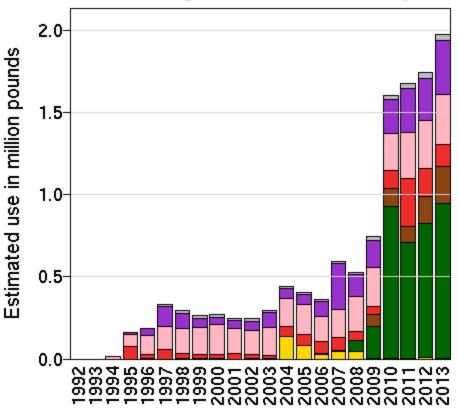

### Are conditions getting better or worse?

### What is the magnitude and extent of any problems?

| 2013-2014 Tier II<br>Fipronil Results | Year | Fipronil | Fipronil<br>Sulfide | Fipronil<br>Sulfone | Fipronil<br>Desulfinyl |
|---------------------------------------|------|----------|---------------------|---------------------|------------------------|

# CECs – Neonicotinoids – e.g., Imidacloprid

- Toxic to insects, especially chironomids
- Detections are increasing (e.g., Region 3 and 7 collaborative monitoring with DPR)
- Highly soluble water column toxicity testing
- Proposed collaboration with DPR at 10 SPoT sites
- Future 303(d) listings?

USGS NAWQA data

#### Use by Year and Crop

### **Contaminants of Emerging Concern**

- 1. The Pesticide Treadmill (or Pesticycle) has led us through a number of chemical classes:
  - Organochlorines (DDT) > Organophosphates (chlorpyrifos) > Pyrethroids (bifenthrin) > Phenylpyrazoles (fipronil) > Neonicotinoids (imidacloprid)
- 2. Lists of CECs from SFEI and SCCWRP include pyrethroids and fipronil, but detections of imidacloprid are on the rise.
- 3. Continued collaboration with DPR's Surface Water Monitoring will enable SPoT to stay ahead of the Pesticycle and detect emerging pesticides before significant impacts occur.
  - 1. Additional funding will enable the SPoT Program to implement a water monitoring component that will screen DPR stations for toxicity to *Hyalella azteca* and *Chironomus dilutus*.
  - 2. DPR connection will also aid the State Board Stormwater Strategy to Establish Statewide Framework for Urban Pesticide Reduction.

### **Collaborations with Department of Pesticide Regulation**

- Intensive Site Study Monitoring four stations (2 DPR and 2 SPoT) for significant decreases in concentrations of pyrethroids as a result of new label laws implemented by DPR. New labels went into effect in 2012.
  - 1. Results so far show no significant decrease in pyrethroid concentrations.
- Regional Water Board Studies Conducting toxicity testing with alternative species at DPR surface water monitoring stations (Regions 3 and 7).
  - 1. Results show significant toxicity at many of DPR's agricultural monitoring stations when tested with *Hyalella azteca* or *Chironomus dilutus*.
  - 2. Agricultural monitoring in Region 3 through the Cooperative Monitoring Program showed no toxicity when tested with EPA 3-species.
  - 3. Results led to SWAMP memo on toxicity organism recommendations.

## **BMPs to Reduce Contaminant Loading**

- 1. SWAMP Regional monitoring at DPR agricultural monitoring stations have provided toxicity and chemistry data on current-use and emerging pesticides.
- 2. Management practice effectiveness projects demonstrate the treatment of contaminants associated with toxicity.

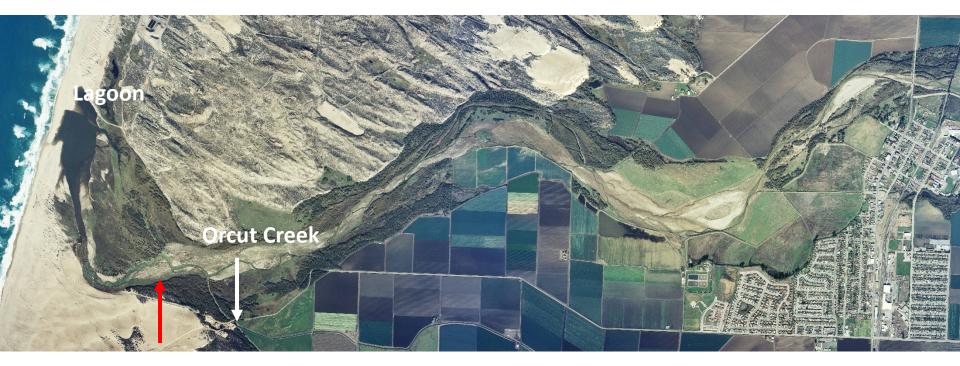

#### **Orcutt Creek Treatment Channel**

Orcutt Cr.

OC Discharge = 27-159 L/s Previous projects = 5-10 L/s Targeted treatment volume = 3-37%

## Project Example: Orcutt Creek Lower Santa Maria River

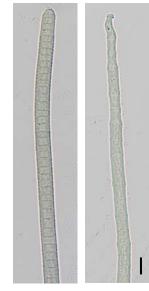

**Lower SM River** 

### Potential for Algal Toxins to Influence Field Monitoring Results -

- Toxin producing benthic algae
  - e.g., Anatoxin-A
  - Neurotoxin nicotinic ACh binding
- Toxic to standard monitoring species?
- Recent concerns about unexplained toxicity in "reference streams" and possibility of impacts on in-stream benthic macroinvertebrates

Russian River Phormidium

# Phormidium highly toxic to C. dubia –

|        |             |              | C. dubia   | C. dubia   |
|--------|-------------|--------------|------------|------------|
|        |             | Anatoxin-A   | % survival | % survival |
| Algal  | Anatoxin-A  | Estimated    | 24h        | 48h        |
| Strain | Conc. (ppb) | At 25% (ppb) |            |            |
|        |             |              |            |            |
| PTRS1  | >525        | > 131.3      | 60%        | 10%        |
|        |             |              |            |            |
| PTRS2  | 343         | 85.8         | 40%        | 0%         |
|        |             |              |            |            |
| PSRS3H | 193         | 48.3         | 70%        | 0%         |

Next Steps: Dose response testing with C. dubia, H. azteca and C. dilutus

Phormidium also produces saxitoxin

# **SPoT and Integrated Monitoring**

| Intensive Site Study with the Department of<br>Pesticide Regulation                           | Determine the effectiveness of new pyrethroid pesticide label regulations (effective 2012)  |
|---|---|
| Agricultural Surface Water Monitoring with the<br>Department of Pesticide Regulation          | Collaboration with Regions 3 and 7 to determine toxicity to alternate species and presence of emerging pesticides   |
| Cyanobacteria CEC Monitoring with CSUMB<br>Algal Toxicity with NCRWQCB and CSSM               | Determine presence and potential effects of the cyanotoxin microcystin, and effects of algal toxins on invertebrates  |
| Collaboration with Bioassessment Monitoring<br>Programs: SMC, PSA, NAWQA/CSQA(?)              | Linking SPoT toxicity and chemistry data with bioassessment data to support causal assessments  |
| State and Regional Water Board<br>303(d) Listings through the<br>Integrated Reporting Process | Water Boards assess water quality monitoring data for<br>California's surface waters to determine if they contain<br>pollutants at levels that exceed protective water quality<br>standards |
| Agricultural Monitoring for the<br>Region 3 -Cooperative Monitoring Program                   | SPoT provides data for conditional waiver of waste discharger requirements  |
| Agricultural Monitoring for the<br>Region 5 - Irrigated Lands Regulatory Program              | SPoT provides data for the monitoring of agricultural runoff in the Central Valley  |
| Stormwater Monitoring for Region 2<br>Stormwater Permits                                      | SPoT data provide long-term trends for San Francisco Bay Area<br>municipal stormwater permits   |
| Regions 4, 8 and 9<br>Stormwater Monitoring Coalition Site Overlap                            | SPoT sites overlap with several SMC monitoring locations and provide additional data  |
