

**Information on Irrigated Crop Acreages and Irrigation Methods within the South Delta Water Agency**  
**California Department of Water Resources**  
**Land and Water Use Section**  
Jean Woods

October 6, 2009

Note: The first five spreadsheets following this sheet summarize irrigated crop acreages based upon data from land use surveys conducted by DWR. Spreadsheets seven through eleven contain the attribute data used for the summaries.

**This Excel workbook contains information on the following:**

**1 Summaries of Crop Acreages from the California Department of Water Resources' Land Use Surveys**

**Survey Years :** 1976, 1988, 1996 and 2007

**Areas :** The acreages in the worksheets represent land within the South Delta Water Agency (SDWA) surveyed during each year listed and mapped in a digital format. The survey conducted during 2007 did not include a portion of the SDWA located in the southern part of the SDWA. Total acreages within the SDWA included in the digital survey maps are the following: 1976 - 146,549 acres, 1988 - 146,549 acres, 1996 - 146,549 acres, and 2007 - 140,871 acres.

**Irrigated acreages :** Irrigated acreages are represented by the values in the "net irrigated acreages" columns. "Gross irrigated acreages" include some areas of unpaved field roads and other uncropped land. Surveys conducted in 1976, 1988 and 1996 included these uncropped areas within polygons representing crops, so we multiply the gross acreage of cropped fields (polygons) in the digital survey map by 0.95 to estimate the irrigated crop area. For the 2007 survey, unpaved roads and other uncropped areas were for the most part excluded from polygons representing cropped fields, so acreages do not need to be adjusted.

For the purpose of calculating irrigated acreages, safflower was considered a special case. During the 1976, 1988 and 1996 surveys, all safflower was mapped as irrigated. Safflower is frequently a partially irrigated crop that relies on tapping deep soil moisture to sustain the crop during the last half of the growing season. In many areas, it is grown in rotation with other crops, utilizing the deeper soil moisture remaining from the previous year's irrigation. For the 2007 survey, some fields of safflower were mapped as non-irrigated based upon the lack of evidence on the soil surface of previously applied water. For the calculation of irrigated crop acreages, safflower mapped as non-irrigated in 2007 was included with the acreage of irrigated safflower to maintain consistency with acreages of this crop in earlier surveys.

**2 Summary of Irrigation Methods Mapped in 2007**

The summary of irrigation methods by crop is based upon the 2007 land use survey.
