

Low flow = warmer water which encourages predatory fish. Low flow does not help the fish survive to get to the Delta. While farmers absolutely need water to grow our food - all water conservation practices will result in less waste. When there is less flow to the Delta, it becomes more salinated. Let's look at the whole river + delta system for the benefit of farmers upstream + in the Delta + wildlife everywhere.

Thanks,
Dail Bolinger
Dear Chair Felicia Marcus + Board Members
State Water Resource Control Board

I have just had a fabulous trip on the American River on a rafting trip. I love RIVERS. Fish love RIVERS! Salmon NEED RIVERS - and they need some greater flow. Over the past decade the salmon flow from the Tuolumne River has decreased drastically.
