Subject: Lake tulloch

I have monitored the water distribution methodology at New Melones and Tulloch for over 20 years. I recognized years ago that there were problems with the current system. When I asked how to make changes to the system I was told that there is too much bureaucracy involved. The current extended drought has brought to light the deficiencies in the current water distribution system.

Tri dam and the local communities are significant stakeholders in the success of a a balanced water retention and distribution methodology. This methodology can balance healthy rivers, fish, power generation, recreation, local needs, and irrigation.

Please support the current compromise reached between the Federal government and Tri Dam.

PLEASE work with Tri Dam and the local community to come to a long term water distribution methodology balancing all stakeholders, using real science, that avoids emergency situations like we are currently in.

Our community is banding together to support the creation of the above described program. speaking for myself, I feel as though your department has marginalized this issue and that a true dire situation is looming. Please help us
