

# LATE COMMENT

To Whom It May Concern:

Recovering salmon populations need adequate flows from the Merced, Tuolumne, and Stanislaus Rivers. 35% of unimpaired flow is woefully inadequate and will hasten the extinction of migratory fish populations. The 35% flow rate contradicts its 2010 flow criteria report, in which it concluded that 60% unimpaired flow from the Lower San Joaquin river would be necessary to restore fish populations.

Sincerely,

Kathleen Kimberling
