

All,

We've seen previous studies concerning the Delta water quality showing a need for more freshwater traveling through the system, rather than less. What will increased salinity levels mean for the freshwater fish and Delta farmlands. I ask you to revise your thought processes and reconsider other alternatives, such as water conservation, locally sourced water supplies, and crop management more acceptable for a given region (example: why plant almond trees requiring a year-round source of water in a desert environment?)

Thank-you,
Sean Murphy
